Re: Ishuk Anastasia

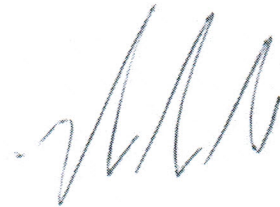

This is a 15 year old girl from Kiev who, 6 years ago, had a brain hemorage and was later operated for kliping of an aneurysm. She has Hemiparesis. She is treated with Topamax 25 m"g twice a day and since then did not have serious seizures for the last year.

She denies headaches or vomiting. She is a good student at school.

Plan:

1. MRI, MRA
2. Pediatric neurology
3. Pediatric Ophthalmological including visus, fundus and visual field's.

Following all this, we will consult with our college's regarding the need for a formal catheterization.
